0. Productinformation

Based on some breakdowns on gear housings in the past, stripped thread on the clamping lever , we mounting a Helicoil – insert in the gear box serially since Mai 2010. (siehe picture)

1. Technical Data

Order Reference	7 270 30 00 23 4	
Type	KBM 50 Q	
Input	Watts	1200
Output	Watts	680
Speed, full load	R.P.M.	260/520/min
Current type		1~
Protection class		I
Cable length with plug	m	4
Net weight	kg	12
Capacity in steel max. Ø, core drill	mm	12-50
Capacity in steel max. Ø, spiral drill (with drill chuck)	mm	16
Threaded drill	M	16
Tool holder on drill shaft		Quick IN
Magnetic holding power	N	11000
Drilling depth max. with core drill	mm	50
Height (drill jigs)	mm	368
Stroke (adjustable)	mm	135-310
Magnetic foot dimension	mm	180 × 90

2. Maintenance

Please make sure that electric tools are repaired, serviced and tested by specialists only as repairs carried out in an inexpert manner may cause considerable hazards for the user (**BGV A2**).

Repeated tests are to be performed in accordance with **DIN VDE 0702-1**.

The regulations in accordance with **DIN VDE 0701 Part 1** are to be observed after any repairs.

Withstand voltage at 1000 V (Protection class 1)

Use original FEIN spare parts only!

During commissioning, while working and during maintenance of the core drilling unit, applicable national accident prevention requirements of the professional organization must be observed.

The law governing technical working equipment (Device Safety Law) applies in terms of proper use.

2.1. General Maintenance Tasks

- Check the power cord (900) for areas of damage.
- Blow out the motor with dry compressed air.
- Check the carbon brushes (2.2.).
- Small functional test (3.1.).

2.1.1. Maintenance intervals:

Depending on the nature and duration of use, no later than after 6 months:

- Clean the drill motor.
- Brush or blow out the brush holder and insulating parts.

2.2. Replacing the carbon brushes:

The drill motor is equipped with carbon brushes that shut off automatically. After the minimum length of the carbon brushes has been reached, the power supply is interrupted. If this happens, the carbon brushes must be replaced by an electrical specialist. If you are using new carbon brushes, make certain to check that they move easily inside the brush holder. Allow new carbon brushes to run for 15 minutes without load.

Use only

original **FEIN** carbon brushes!

3. Electrical / Functional Tests

- 3.1. Minor functional test**
- 3.2. Major functional test**
- 3.3. Test data**
- 3.4. Test devices and auxiliary materials**
- 3.5. Wiring diagram**
- 3.6. Safety test**
- 3.7. Functional test**

Fein Repair Tool

3.1. Minor functional test

3.1.1. Self-start lock and magnetic foot

Turn on the master switch and the motor switch. Then connect the core drilling machine to the electrical power.

- The motor must not start up.
- The magnetic foot is energized.
- Check the power consumption (0.4 A, see 3.3. Test data).

Motor switch off.

- Magnetic foot remains energized.
- Power consumption must be reduced to one half (0.2 A, see 3.3. Test data).

3.1.2. Motor

Motor switch on.

- Motor starts up.

3.1.3. Characteristic curve of the motor

Place the motor under load.

- Speed is regulated.
- From about 1600 Watts on the speed drops off more sharply.

3.1.4. Overload switch off

Place the motor under heavy load.

- The motor switches off after 10 seconds.

The motor must be run at idle for about 60 seconds before the test.

3.2.1. Major functional test

	Possible causes	Test possibilities
Magnetic foot does not energize: <input checked="" type="checkbox"/> Check with magnetisable part	• power cable disconnected, switch off, connector not plugged in	<input checked="" type="checkbox"/> LED on board must light up briefly while switching on. <input checked="" type="checkbox"/> check power voltage on X1, X2 continuity
	• magnetic foot defective	<input checked="" type="checkbox"/> LED on board is flashing <input checked="" type="checkbox"/> measure resistance ($504\Omega \pm 5\%$)
	• electronics defective	<input checked="" type="checkbox"/> LED on board is flashing <input checked="" type="checkbox"/> measure voltage on X7.1 and X7.2 .
Magnetic holding force too weak:  <input checked="" type="checkbox"/> measure the removal force required	• do not turn on while testing motor switch	<input checked="" type="checkbox"/> measure the voltage on X7.1 and X7.2
	• magnetic foot defective	<input checked="" type="checkbox"/> measure resistance ($504\Omega \pm 5\%$)
	• standing surface uneven	<input checked="" type="checkbox"/> visual inspection
	• electronics defective	<input checked="" type="checkbox"/> measure the voltage on X7.1 and X7.2

Note: If the magnetic foot is defective, no further tests are possible.
Because of magnetic foot monitoring, the motor cannot be turned on.
→Connect the spare magnetic foot.

3.2.2. Major functional test

	Possible causes	Test possibilities
Motor does not start up:	<ul style="list-style-type: none">• Switching sequence not maintained• Power cord disconnected, switch off, connector not plugged in• Magnetic foot defective• Error in motor power supply line• Motor switch defective• Carbon brushes worn out• Motor defective• Electronics defective	<ul style="list-style-type: none">☒ Turn master switch on first, then motor switch☒ LED on board must light up briefly while turning on.☒ Test mains voltage on X1, X2☒ Test continuity☒ LED on board flashes☒ Measure resistance ($504 \Omega \pm 5\%$)☒ Test continuity☒ Test☒ Visual inspection☒ Test motor without electronics (at max 145 V AC, see 3.3) Measure idle speed☒ If motor is defective, connect replacement motor to X5, X6 and connect cable from speed recorder to X8. Measure idle speed or voltage

The reasons listed here all cause the automatic startup disable to engage

3.2.3. Major functional test

	Possible causes	Test possibilities
Motor only starts up briefly (1s):	• Speed cable defective, intermittent contact	☒ Check continuity, connection contact
	• Assembled ring magnet	☒ Visual inspection (loop tracks)
	• Assembled speed recorder, speed recorder defective	☒ Connect replacement speed recorder
Motor switches off for no apparent reason:	• Intermittent contact on the power cord, switch, plug connections	☒ LED on board must light up briefly while turning on. ☒ Check continuity on X1, X2
	• Magnetic foot	☒ LED on board flashes ☒ Measure resistance ($504 \Omega \pm 5\%$)
	• Electronics	☒ LED on board flashes ☒ Measure voltage on X7.1 and X7.2.
The reasons listed here all result in the automatic startup disable being activated		

3.2.4. Major functional test

	Possible causes	Test possibilities
No discernable control behavior: <input checked="" type="checkbox"/> Check idle speed	<ul style="list-style-type: none">• Electronics defective	<input checked="" type="checkbox"/> Characteristic curve of motor <input checked="" type="checkbox"/> Place motor under load. <input checked="" type="checkbox"/> Speed is regulated. <input checked="" type="checkbox"/> From about 1600 Watts on the speed drops off more sharply.
Speed too high or too low; speed fluctuates: <input checked="" type="checkbox"/> Check idle speed	<ul style="list-style-type: none">• Motor defective	<input checked="" type="checkbox"/> Test motor without electronics (at max 145 V AC, see 3.3) Measure the idle speed
	<ul style="list-style-type: none">• Ring magnet defective	<input checked="" type="checkbox"/> Visual inspection (loop tracks)
	<ul style="list-style-type: none">• Electronics defective	<input checked="" type="checkbox"/> If motor is defective, connect replacement motor to X5,X6 and connect cable from speed recorder to X8. Measure idle speed or voltage.
	<ul style="list-style-type: none">• Additional mechanical load (gears, bearing, vibrations, etc.)	<input checked="" type="checkbox"/> Test <input checked="" type="checkbox"/> Measure idle current
	<ul style="list-style-type: none">• Commutator or carbon brushes defective	<input checked="" type="checkbox"/> Visual inspection for brush sparking

3.2.5. Major functional test

	Possible causes	Test possibilities
Overload switch-off too early, too late or no switch-off	<ul style="list-style-type: none">• Electronics defective	<ul style="list-style-type: none">☒Measure time☒Activate overload switch-off. Heavier load will switch motor off after 10 seconds.
Motor starts up even though:		
- motor switch was activated before master switch	<ul style="list-style-type: none">• Electronics defective	<ul style="list-style-type: none">☒Check again after replacing electronics
- power supply line was plugged in while switches were closed	<ul style="list-style-type: none">• Electronics defective	<ul style="list-style-type: none">☒Check again after replacing electronics
- magnet is defective or not connected to the electronics	<ul style="list-style-type: none">• Electronics + magnetic foot defective	<ul style="list-style-type: none">☒Check again after replacing electronics / check magnetic foot
- power cord was plugged in with damaged master switch and motor switch	<ul style="list-style-type: none">• Electronics defective	<ul style="list-style-type: none">☒Check again after replacing electronics

Fein Repair Tool

3.3. Test data

Rated voltage	220 – 240 V
Test voltage / " 10%	230 V
Idle current / " 10% ¹⁾ (2.25-2.88 A)	2.5 A
Idle speed / " 3% (504-536/min)	520/min
Main switch on	100 V DC
Voltage on: X7.1, X7.2 " 10% ³⁾	
Motor switch on, master switch on, self-start lock active	200 V DC
Voltage an: X7.1, X7.2 " 10 % ³⁾	
Min. removal force: magnet new / used	4500N/4050 N
Master switch on	0.2 A
Current consumption of magnetic foot " 10% ⁴⁾ at 25°C	
Motor switch on, master switch on, self-start lock active	
Current consumption of magnetic foot " 10% ⁴⁾ at 25°C	0.4 A
Resistance of magnetic foot " 5% at 25°C	504 Ohm
Test voltage of motor without electronics	145 VAC

1) Motor current + magnetic flux current. Idle may be significantly less for machines that are well worked in.

2) Measurement on ground steel plate (St37/500 □ 250 □ 25 mm). Activate motor switch first, then master switch. The drill shaft of the drill motor is pressed against the dynamometer by means of a slewing ring.

3) Nominal voltage, DC.

4) Measured on the power supply line and KBM 50 Q standing on a ground steel plate (St37/500 □ 250 □ 25 mm).

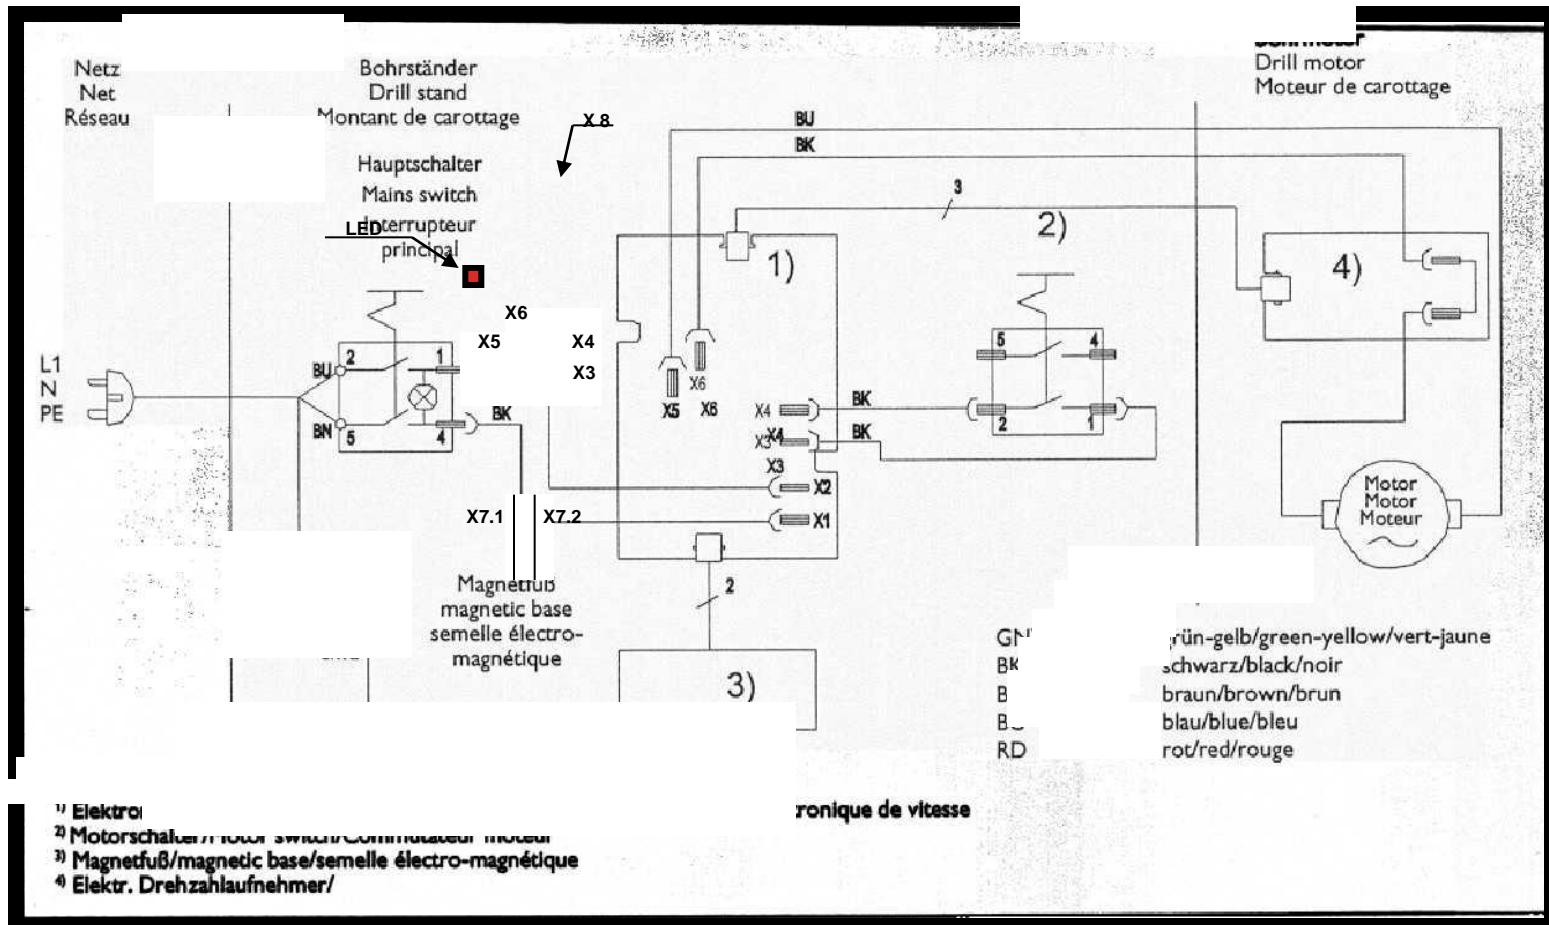

3.4. Test devices and auxiliary materials

- Multimeter for effective value measurement (voltage, current, resistance).
- Speed measuring device
- Dynamometer for measuring pressing forces up to about 5000 N.
- Ground steel plate, for example ST 37
(dimensions in mm: ca.. 500x250x25)
- Isolating transformer, adjustable
(for testing the motor without electronics at 145 V AC)

3.5. Circuit diagram / connection diagram

Fein Repair Tool

3.6. Safety test (immediately after about 15 min. runup)

	Test steps	Test type
1.	Removal force	<ol style="list-style-type: none">1. Place KBM on ground steel plate (St 37) .2. Plug the power cord into the power socket.3. Turn the motor switch on; only after that turn the master switch on4. Measure the removal force, min 4500N (new) or min 4050N (used) with dynamometer
2	Restart disable	<ol style="list-style-type: none">1. Connect the KBM 50Q to 230 V/50 Hz2. Master switch and motor switch “ON“3. If the machine starts up, disconnect the power cord4. Connect the power plug to the electrical power again = machine must not start up
3.	Protective ground line test	<ol style="list-style-type: none">1. Disconnect Measurement points: gear head against PE on plug Idle voltage on the measurement device: 4 V-24 V, AC or DC Measurement current: min. 0.2 A Test time: 3 sec PE resistance: max 0.3 Ohm with power cord 4m long
4.	Isolation test	<ol style="list-style-type: none">1. Disconnect2. Connect L1 and N3. Master switch and motor switch “ON“ Measurement points: gear head and screws (270) against L1/N Test time: 3 sec Test voltage: 500 V DC Isolation resistance: min. 2.0M Ohm
5.	High-voltage test	<ol style="list-style-type: none">1. Disconnect2. Connect L1 and N3. Master switch and motor switch “ON“ Measurement points: gear head and screws (270) against L1/N Test time: 3 sec Test voltage: 1000 V AC Triggering current: 5 mA

Please
note!

The requirements of DIN VDE 0701 Part 1 (Appendix "E" for electr. tools), current version, are definitive for the safety test.

3.7. Functional test

1. Set both switches to the “0” position.
2. Connect KBM 50 Q to the power supply (230 V/50 Hz).
Turn on the master switch and motor switch.
3. Idle current test:

min.	2.25 A
max.	2.88 A
4. Idle test measured on the drill shaft:

Run up time:	min. 10 sec	
Test time:	min. 3 sec	
Speed:	min. 504 rpm	- gear level 2
	max. 536 rpm	- gear level 2

4. Disassembly of the Core Drill Unit

- 4.1. Preparation
- 4.2. Drill motor - loosen the drill rig
- 4.3. Drill motor - gear
- 4.4. Motor housing
- 4.5. Drill rig

Fein Repair Tool

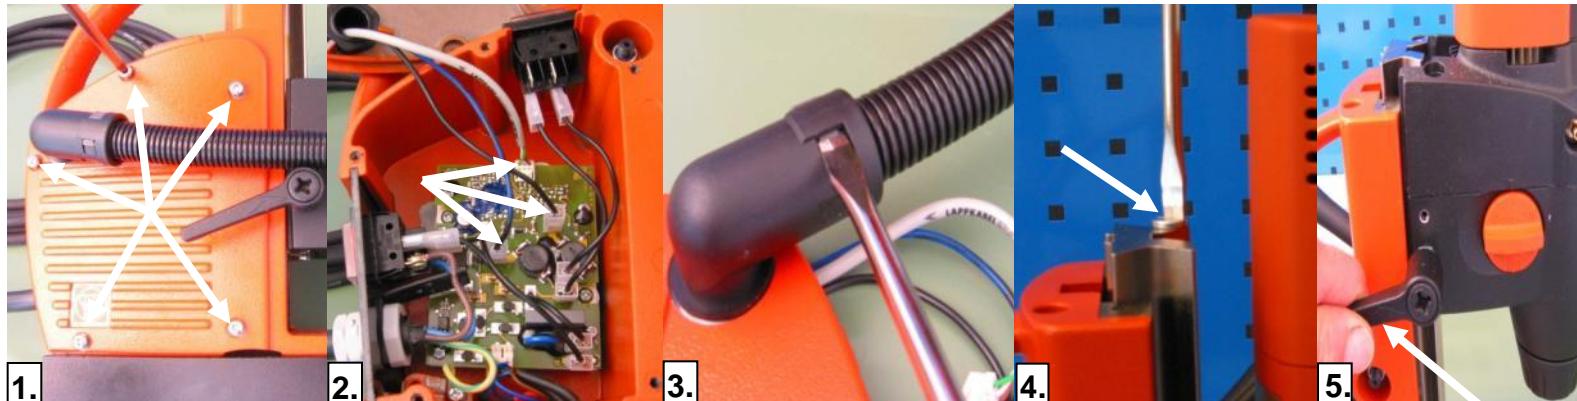

4.0. Preparation

1. Disconnect >>> pull the plug <<<
2. Set switch to “OFF” position
3. Remove accessory clamped in place.

Fein Repair Tool

4.1. Drill motor – loosen the drill rig

1. Remove the cover (1050) from the drill rig housing (700).
2. Disconnect the cable (250, 260, 265) from the board (990).
3. Loosen the safety strap on the SEM bracket (1060) with a screwdriver and disconnect the protective hose.
4. Remove the upper flat-headed screw (810).
5. Loosen the clamping lever (620) and lift the drill motor (10-620) up and out.

Tools:

- PH2 cross-slotted screwdriver
- Slotted screwdriver, 1.2 X 6.5

4.2.1. Drill motor - gear

Tools:

1. Remove the cylinder screw ([590](#)) and take off the gear case ([280](#)).
2. Remove the spur wheel shaft ([510](#)) with the spur wheel ([520](#)).
3. Dismount the switch button ([530](#)) after removing the locking ring ([570](#)).
Dismount the spur wheel shaft ([460](#)) with spur wheel ([490](#)) and switching wheel ([480](#)).
4. Remove the locking ring ([450](#)), spur wheel ([440](#)) and feather key ([470](#)) and remove the locking ring ([420](#)). (Remove the grease).

- Allen wrench SW4
- Seeger ring tongs (outer, offset)
- Seeger ring tongs (outer, straight)
- Plastic hammer

Fein Repair Tool

4.2.2. Drill motor - gear

Tools:

1. Drive the drill shaft (320) forward out of the gear case (300).
2. Remove the locking ring (310) and drive out the grooved ball bearing (300) with the sleeve.
3. Remove the bearing (100, 290) with the Kukko bearing inside remover.

- Plastic hammer
- Sleeve
(E/I/H=40/24/60)
- Seeger ring tong
(inner, straight)
- Bearing inside
remover (Kukko)
- (21-00, 21-02)
- Fork wrench
SW:12,14,22

Fein Repair Tool

4.2.3. Drill motor - gear

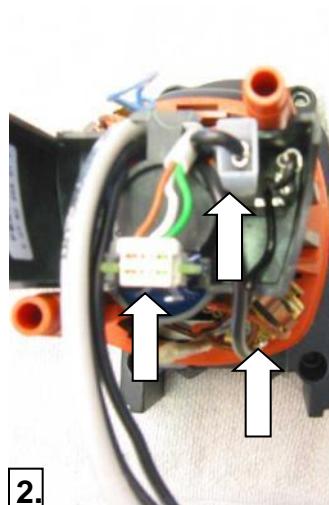

1. Remove the locking ring (410) and pull the clamping sleeve (400) forward.
Caution: The clamping sleeve is under tension!
2. Remove the balls (390) and shank spring (380).
3. Dismount the locking ring (390).
4. Remove the disk (350), sleeve (340) and the compression spring (330).
Caution: All parts are under tension from the compression spring.

Tools:

- Seeger ring tong (inner, straight)
- Seeger ring tong (outer, straight)

4.3.1. Motor housing / cover

Tools:

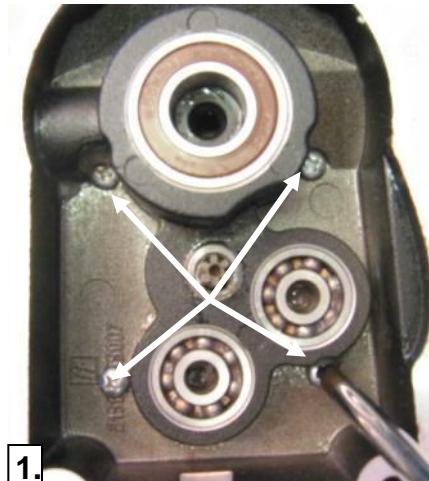

1. Remove the screws (270) and lift off the cover (210) .
2. Pull out all the cables.
3. Pry off the electronic speed recorder (170) by bending back the locking lugs.
4. Remove the screws (200) and take out the brush holder (190).
(Take the carbon brushes out of the brush holder and pull out the cable.)

- PH2 cross-slotted screwdriver
- Slotted screwdriver, 1.2 X 6.5

Fein Repair Tool

4.3.2. Motor housing

1. Remove the screws **(140)** .
2. Separate the intermediate bearing **(90)** from the motor housing.
3. Dismount the armature **(40)** from the motor housing **(10)** .
4. Remove the air guide ring **(30)** from the motor from the motor housing.
5. Remove the field magnet **(20)** from the motor housing **(10)** .

Caution: Cables must not be left hanging anywhere!

Tools:

- PH2 cross-slotted screwdriver
- Plastic hammer

Fein Repair Tool

4.3.3. Motor housing / armature

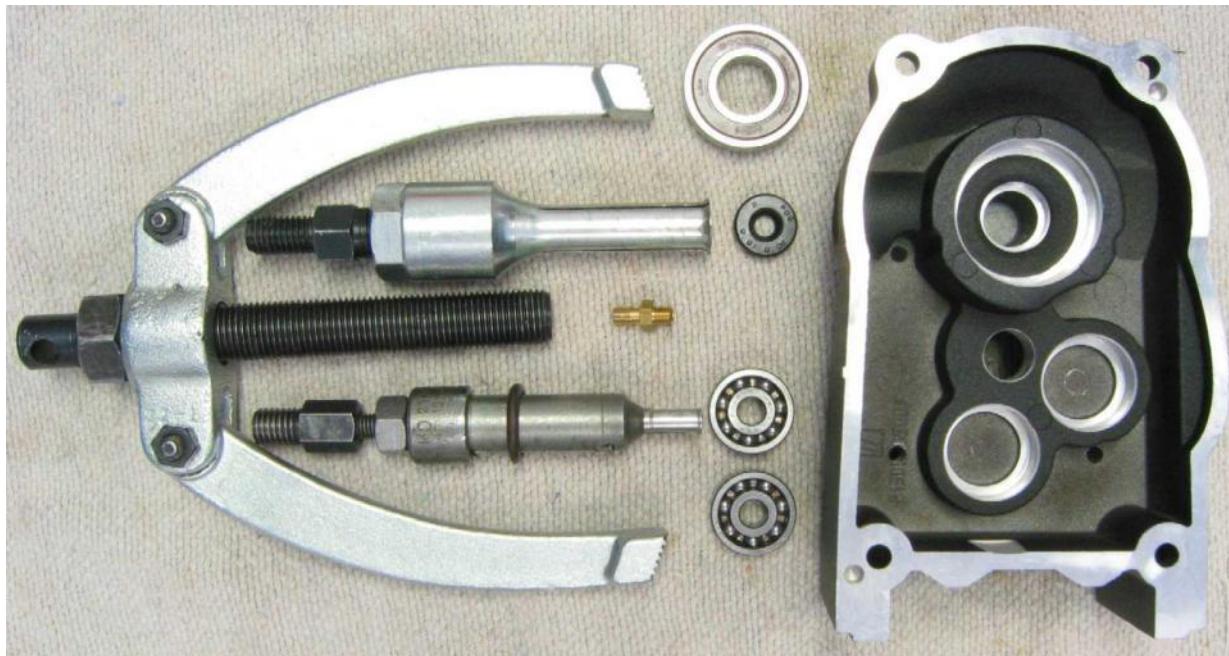

Tools:

1. Remove the Nilos ring (135). Pull the groove ball bearing (70) together with the sealing ring (80) from the armature (40) with the removal tool.
2. Pry off the insulating sleeve (150) and ring magnet (160) with a screw driver.
3. Remove the groove ball bearing (50) with the removal tool.

- 2 screwdrivers
- Ball bearing Pull-of cone (64104150008)
- Clamping body D26 (64107026000)
- Clamping body D19 (64107019007)

4.3.4. Motor housing / intermediate bearing

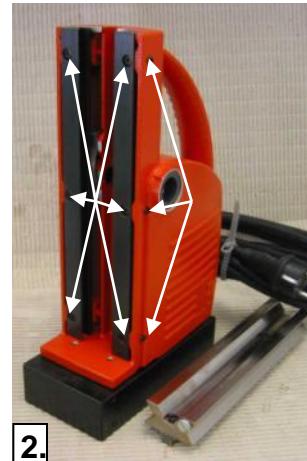

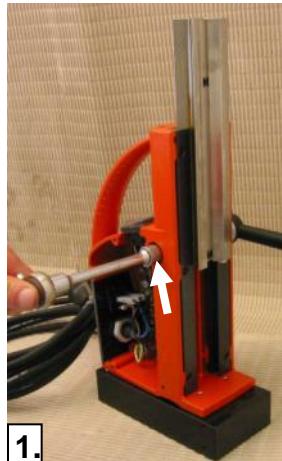

Tools:

- Bearing inside removal tool (Kukko)
 - (21-00, 21-02)
 - Fork wrench SW:12,14,22
- Screwdriver (slotted)
- Socket wrench (SW 7)

1. Remove the bearing (100,120) with a Kukko - bearing inside removal tool.
2. Pry out the radial shaft seal ring (110) with a screw driver.
3. Pull out the hose socket (600) .

Fein Repair Tool

4.4.1. Drill Rig

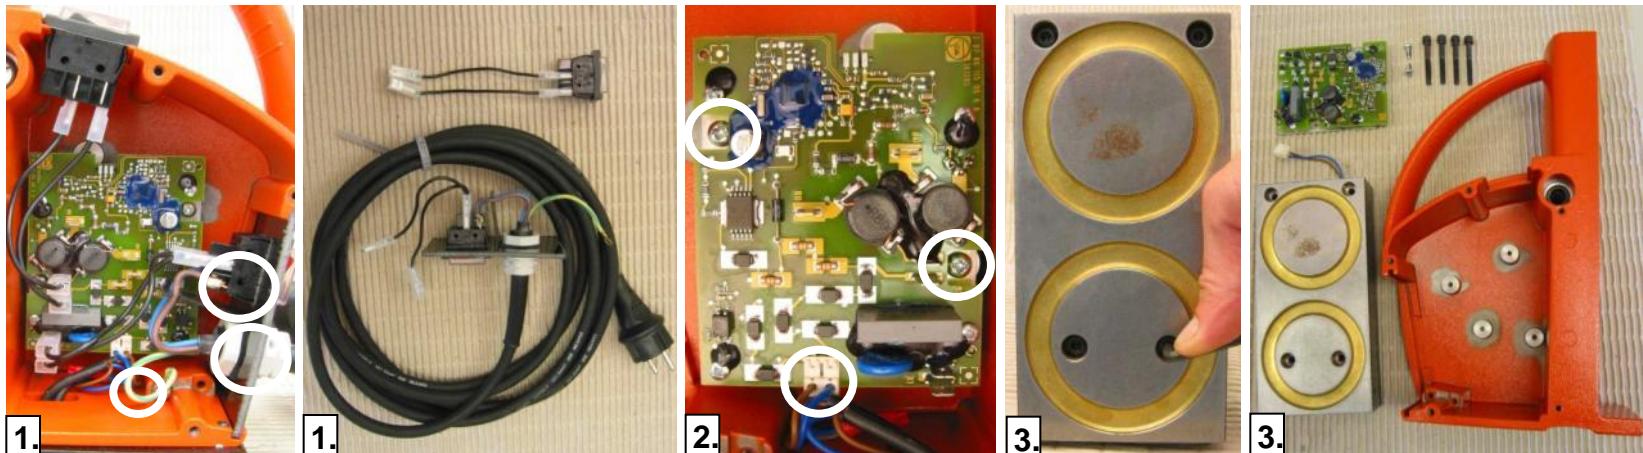

1. Turn the feed on the star handle as far up as it will go. Loosen the hexagonal nut **(870)** and remove the disks **(850)** and cup springs **(860)**. Pull out the drive shaft **(820)**. Unscrew the hand grips **(840)** from the drive shaft **(820)**.
2. Loosen the threaded pins **(760)** and cylinder screws **(730)**. Remove the guide **(800)**, lifting it upward. Dismount the guide strip **(720)** completely.

Tools:

- Nut and ratchet
- SW 13
- Allen wrench
- SW 2,5, 3 and 4
- Screwdriver

4.4.2. Drill rig

1. Remove all connecting cables from the electronic speed controller (990) .
Loosen the grounding connection from the assembled cable (900) and
pull out the entire plate (940) sideways from the housing (700) .
2. Remove the electronic speed controller (990) from the housing (700) after
removing the connection cable to the magnet (880) and removing the
screws (1080) .
3. After you have removed the cylinder screws (890) , take the magnetic
foot (880) out of the housing (700) .

Tools:

- Flat pliers
- Allen wrench
SW 4

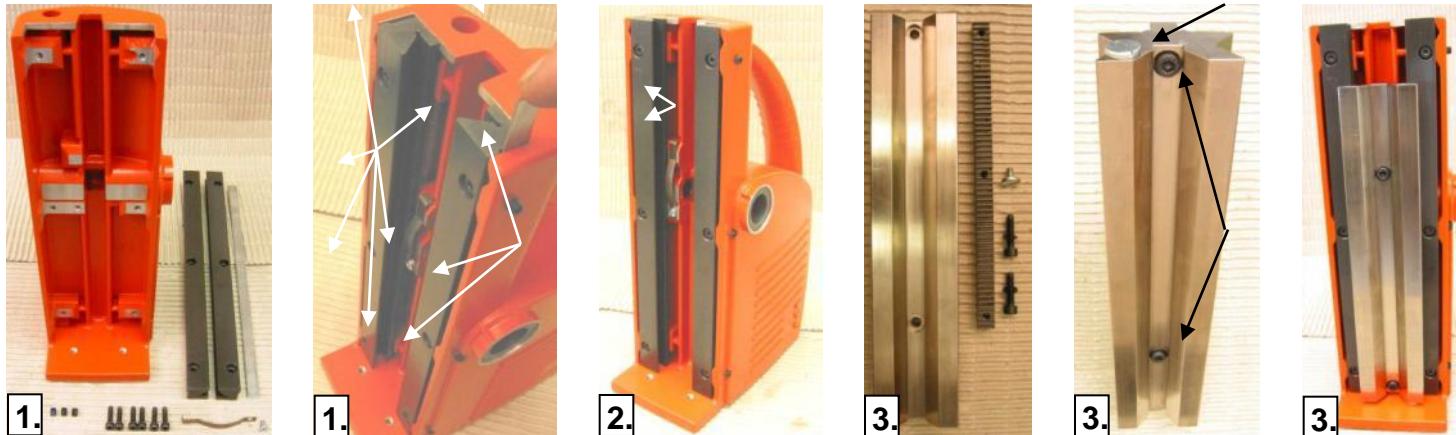

Fein Repair Tool

5. Assembly of the Core Drill Unit

- 5.1 Drill rig**
- 5.2 Motor housing**
- 5.3. Drill motor - gear - Quick IN**
- 5.4. Drill motor connecting to the drill rig**

Fein Repair Tool

5.1.1. Drill rig / guide rails

1. Lightly apply the guide rails (720) with cylinder screws (730). Push the pressure bar (710) behind the guide rail. Lightly set the threaded pins (760) in place.
2. Fasten the leaf spring (740) in place with a oval head screw (750).
3. Screw the gear rack (780) onto the guide (800) with a cylinder screw (790) and lock washer (770). Screw in the lower flat-headed screw (810). Insert the guide (800) into the guide rail (720).

Caution:Lightly grease the dovetail guide in the guide rail (720) with grease 0 40 106 0100
Lightly grease the gear rack (780) with grease 0 40 101 0100 4.

Tools:

- Allen wrench SW 2,5, 3, 4
- PH2 cross-slotted screwdriver
- Grease: 04010601001
- Grease: 04010101004

Fein Repair Tool

5.1.2. Drill rig / drive shaft / guide

1. Push the slide socket (702, 703) into the housing (700) with the appropriate spindle.
2. Set the drive shaft (820) in place. Add the U disk (850), spring washers (860) (in the shape of an X) and the U disk (850). Lightly screw on the hexagonal nut (870). Screw in the hand grips (840).
3. Adjust the guide bar (720) with the threaded pins (760) and tighten the cylinder screws (730).

**Caution: You should be able to move the guide (800) with no play!
Secure threaded pins in place (760) with Loctite 222!**

Tools:

- Spindle Ø=30 mm
- Ø=17.5 mm
- Nut SW 13
- Allen SW 2.5, 3, 4
- Loctite 222

5.1.3. Drill rig / magnet

1. Screw the magnetic foot (880) onto the housing with the cylinder screw (890) and lock washer (770).

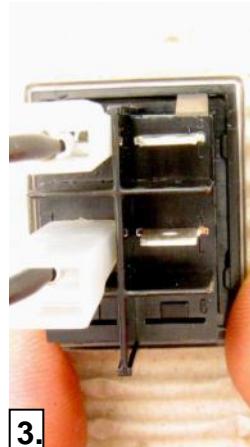

Tools:

- Allen wrench SW 4

Fein Repair Tool

5.1.4. Drill rig / power cord and switch

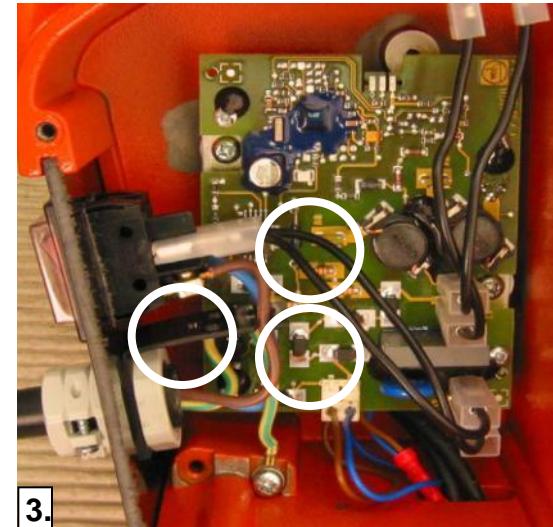

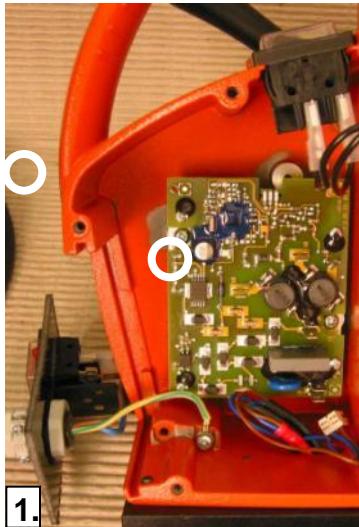

1. Assemble the plate (940) with electrical parts . Plug the cable (1000) onto the master switch (970) according to the circuit diagram. **Caution: The plate is not symmetrical, note position!**
2. Mount the grounding connection with parts (1020, 1030, 1080) .
3. Plug the cable (1000) onto the Off switch (1010) according to the circuit diagram. Push the Off switch (1010) into the housing (900) .

Tools:

- PH2 cross-slotted screwdriver
- Flat pliers
- Pipe grip

5.1.5. Drill rig / speed controller

1. Fasten the electronic speed controller **(990)** in place in the drill jig **(700)** with a oval head screw **(1080)** .
2. Push the assembled plate **(940)** into the groove in the housing **(700)** provided for that purpose.
3. Plug in all cables **(1000)** and the cable for the magnetic foot onto the electronic speed controller **(990)** according to the circuit diagram.

Tools:

- PH2 cross-slotted screwdriver
- Flat pliers

Fein Repair Tool

5.2.1. Motor housing / armature

Tools:

1. Set the terminating plate (60) in place
2. Press on the bearing (70) .
3. Press on the retaining ring (80) and the Nilos ring (135) .
4. Press on the bearing (50) .
5. Push the insulating sleeve (150) and magnet ring (160) on manually.

- Spindle press
- Press-on fixture (64101019008)
- Ball bearing attachment
D = 26
(64107026000)
- Ball bearing attachment
D = 19
(64107019007)

5.2.2. Motor housing / intermediate gear case

1. Install the sealing ring (110) flush in the intermediate bearing (90) .
Caution: note position!
2. Press the groove ball bearing (120) into the intermediate bearing (90) .
3. Press the groove ball bearing (100) into the intermediate bearing (90) .
4. Screw the hose socket (600) into the intermediate bearing (90) .
Caution: Screw in only lightly!

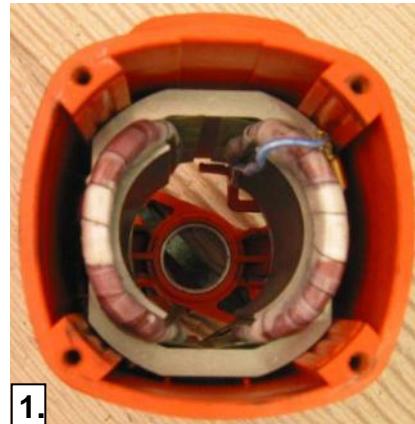

Tip: Warm up the intermediate gear case around about 80°C.

Tools:

- Spindle press
- Spindle:
 - Ø=15.9 mm
 - Ø=21.9 mm
 - Ø=31.9 mm

5.2.3. Motor housing / field coil

1.

1.

2.

1. Place the field coil **(20)** in the motor housing (note position) and press it in with the sleeve (E/I/H/59,5/54/65).
2. Set the air guide ring **(30)** in place in the motor housing (note position).

Tools:

- Spindle press
- Sleeve
(E/I/H/59.5/54/65)
- Cable hook

5.2.4. Motor housing

1. Place the preassembled armature **(40)** in the preassembled intermediate gear case **(90)**.
2. Place the covering flap **(130)** in the motor housing **(10)**.
3. Place the preassembled intermediate gear case **(90)** in the preassembled motor housing **(10)**.
4. Screw the intermediate gear case **(90)** together with the motor housing **(10, 140)**.

Tools:

- Plastic hammer
- Loctite 574
- PH2 cross-slotted screwdriver

Caution! Seal the screw heads with Loctite 574.

5.2.5. Motor housing / cable

1. Fasten the brush holder **(190)** onto the motor housing **(10)** with screws **(200)** tightened to 1.2 Nm.
2. Plug the electronic speed controller **(170)** onto the motor housing **(10)**. Attach the connection cable of the field coil **(20)** according to the circuit diagram.
3. Connect all cables according to the circuit diagram and to the tension relief element on the labyrinth of the electronic speed controller **(170)**.

Tools:

- PH2 cross-slotted screwdriver

Fein Repair Tool

5.2.6. Motor housing / cover

Tools:

- PH2 cross-slotted screwdriver

1. Place the cover (210) on the motor housing (20). Draw all cables along by pulling on the ends of the cables. Fasten the cover (210) with two screws (270).

5.3.1. Drill motor - gear - Quick-IN

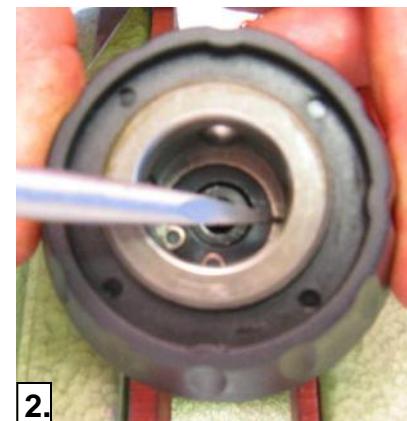

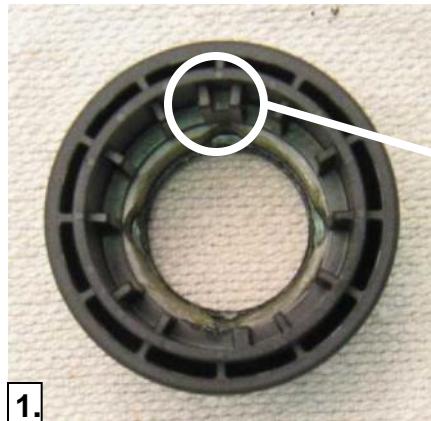

1. Place the compression screw (330), sleeve (340) and disk (350) on the drill shaft (320) and place the locking ring (360) on the drill shaft. Press all parts together on the drill shaft (320) with bolt until the locking ring locks.
2. Strike the clamping sleeve (370) up to a height where it is flush, then set the key feather (430) in place.
3. Place the shank spring (380) in the correct position on the drill shaft (320). Lightly grease the bore hole for the balls (390) and set the balls (390) in place.

Tools:

- Seeger ring tongs (inner, straight)
- spindle ($\varnothing = 17.5$ mm)
- 200 g hammer
- Grease (04010601001)
- Vice
- Soft clamping claw

5.3.2. Drill motor - gear - Quick-IN

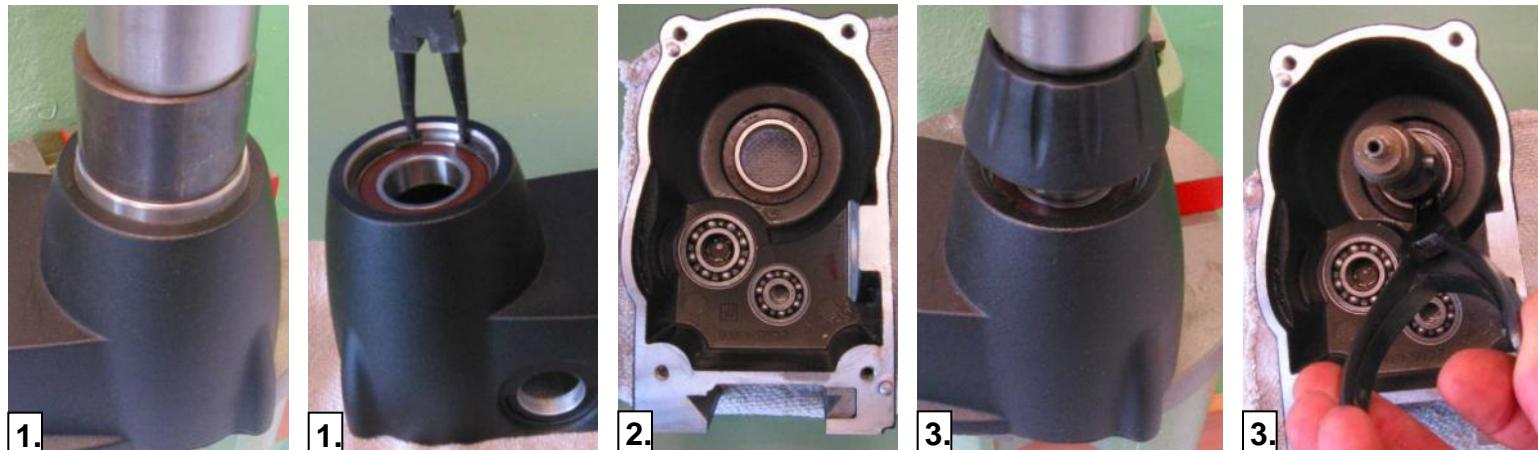

1. Place the clamping sleeve **(400)** on the drill shaft **(320)**. Hook the shank spring **(380)** in the clamping sleeve **(400)**,
2. Tension it by turning anticlockwise (about 90°) until the clamping sleeve **(370)** fixes the balls in place in the clamping area and unlocks. ! Check function with a screwdriver or other tool !
3. Secure the clamping sleeve **(400)** in place with a locking ring **(410)**.

Tools:

- Screwdriver
- Seeger ring tongs (outer, straight)
- Vice (soft jaws)

5.3.3. Drill motor - gear - Quick-IN

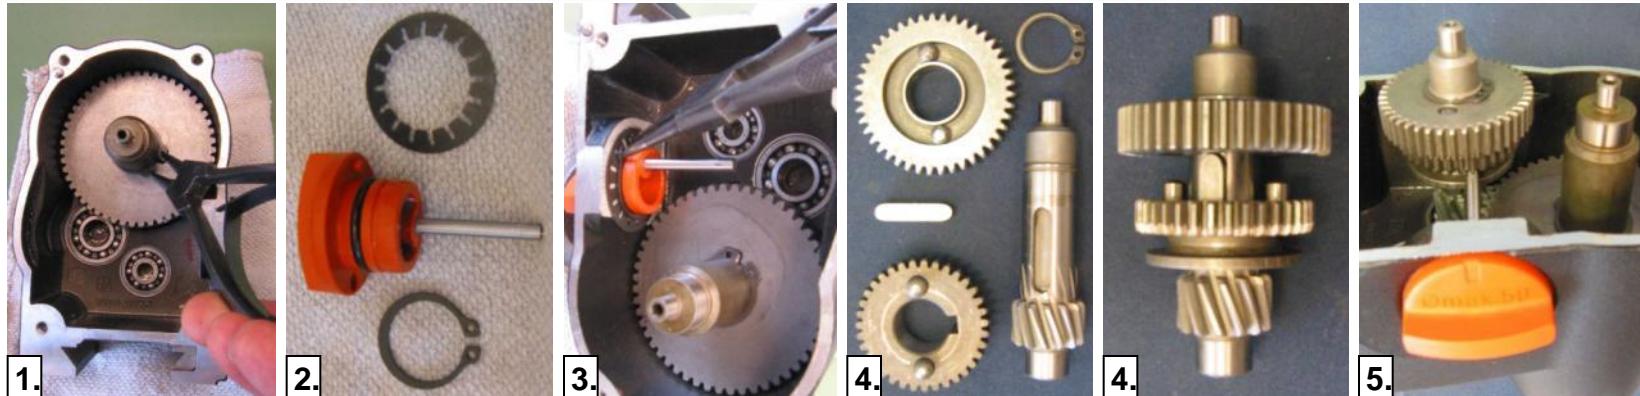

1. Press the groove ball bearing **(300)** into the outer bearing **(280)** and secure it in place with a locking ring **(310)** .
2. Press the groove ball bearing **(100, 290)** in place.
3. Press the drill shaft **(320)** into the groove ball bearing **(300)** and secure it in place with a locking ring **(450)** .

Tools:

- Bearing press-in rings
($E\varnothing=45$ mm)
($E\varnothing=27$ mm)
($E\varnothing=21$ mm)
- Seeger ring tongs (inner, straight)
- Seeger ring tongs (outer, straight)
- Spindle press

5.3.4. Drill motor - gear - Quick-IN

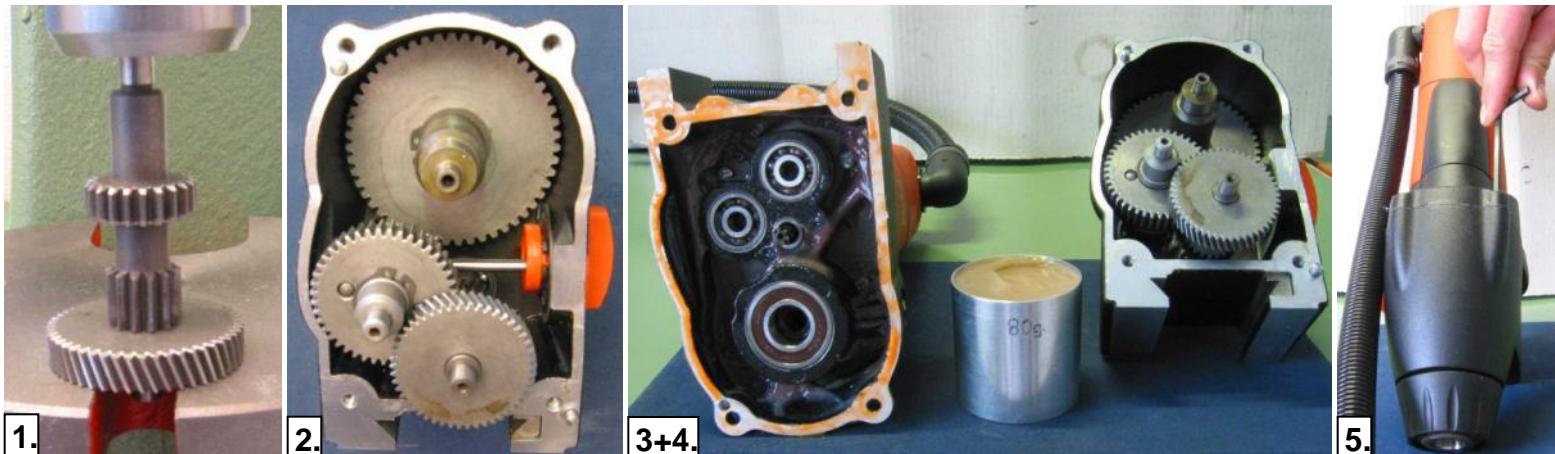

1. Set the spur wheel [\(440\)](#) in place and secure it with a locking ring [\(420\)](#) .
2. Mount the round sealing ring [\(550\)](#) (grease lightly) on the switch grip [\(530\)](#) and press the cylinder pin [\(540\)](#) onto the switch grip [\(530\)](#) as far as it will go.
3. Place the switch grip [\(530\)](#) in the outer bearing [\(280\)](#) and after setting the spring washers [\(560\)](#) in place, secure it with a locking ring [\(570\)](#) .
4. Place the key groove [\(470\)](#) on the spur wheel shaft [\(460\)](#) . Push the spur wheel [\(480\)](#) onto the spur wheel shaft [\(460\)](#) . Set the spur wheel [\(490\)](#) in place and secure it with a locking ring [\(500\)](#) .
5. Place the assembled spur wheel shaft [\(460\)](#) on the groove ball bearing [\(290\)](#) . Insert the cylinder pin [\(540\)](#) in the switching groove of the switching wheel [\(480\)](#) .

Tools:

• Seeger ring tongs
(outer,straight)

5.3.5. Drill motor - gear - Quick-IN

1. Press the spur wheel **(520)** onto the spur wheel shaft **(510)** .
2. Set the assembled spur wheel shaft **(510)** in the groove ball bearing **(100)** .
3. Fill the external bearing **(280)** with 80 g of gear grease (0 40 118 0300 9).
4. Clean both seal surfaces of the gear parts **(90, 280)** . Coat one seal surface with Loctite No. 574.
5. Set the intermediate bearing **(90)** in place and screw it together with cylinder screws **(590)** and lock washers **(580)** .

Tools:

- Spindle press
- Grease
(04011803009)
- Sealant
(Loctite No.574)
- Allen wrench
(SW 4)

5.4.1. Drill motor – connecting to the drill rig

1. Push the drill motor onto the guide (800) on the drill jig and fasten it in place with a clamping lever (620). Screw the flat headed screw (810) tight.
Caution: Check whether the drill motor moves by itself in the guide because of its own weight. This must be prevented because of the danger of injury by tightening the hexagonal nut (870).
2. Place the counternut (1070) on the cover (1050). Screw the round sealing ring (1040) onto the bracket (1060). Pull all cables through and push the protective hose (240) in as far as it will go up to the stop.

Tools:

- PH2 cross-slotted screwdriver
- Slotted screwdriver, 1.2 X 6.5

5.4.2. Drill motor – connecting to the drill rig

1. Plug all cables into the electronic speed controller **(990)** according to the circuit diagram.
2. Fasten the cover **(1050)** in place with a oval head screw **(1080)**.

Tools:

- PH2 cross-slotted screwdriver
- Slotted screw-driver, 1.2 X 6.5

6. Tools

- 6.1. All mechanical tools**
- 6.2. Special tools / technical drawings**
- 6.3. Types of grease and quantities**
- 6.4. Adhesives ,sealants**

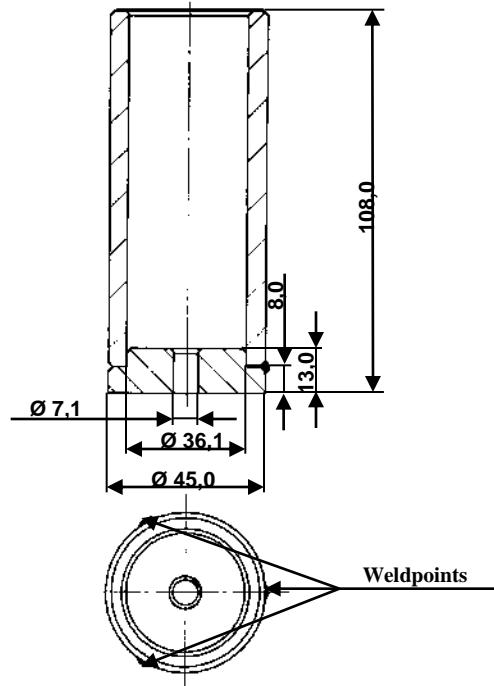

6.1. All mechanical tools

• Spindle press up to 3t	Commercially available
• Vice	Commercially available
• Soft clamping jaws	Commercially available
• Plastic hammer	Commercially available
• Locksmith's hammer 200 g	Commercially available
• Screwdriver PH 2	Commercially available
• Slotted screwdriver	Commercially available
• Seeger ring tongs (inner/straight)	Commercially available
• Seeger ring tongs (outer/offset)	Commercially available
• Seeger ring tongs (outer /straight)	Commercially available
• Flat pliers	Commercially available
• Pipe pliers/ water pump pliers	Commercially available
• Fork wrench SW: 12, 14, 22	Commercially available
• Socket wrench SW: 7	Commercially available
• Bearing removal tool Kukko	21-00
• Bearing removal tool Kukko	21-02
• Nut SW 13 + extension + ratchet	Commercially available
• Sleeve E/I/H	40/24/60
• Sleeve E/I/H	59,5/54/65
• Spindle D = 30 mm	Commercially available
• Spindle D = 17.5 mm	Commercially available
• Spindle D = 15.9 mm	Commercially available
• Spindle D = 21.9 mm	Commercially available
• Spindle D = 31.9 mm	Commercially available
• Bearing pressing ring ED = 45 mm	Commercially available
• Bearing pressing ring ED = 27 mm	Commercially available
• Bearing pressing ring ED = 21 mm	Commercially available

6.2. Special tools / technical drawings

- Pull-of cone 6 41 04 150 00 8
- Clamping body D = 19 mm 6 41 07 019 00 1
- Clamping body D = 26 mm 6 41 07 026 00 0
- Ball bearing attachment D = 19 6 41 07 019 00 7
- Ball bearing attachment D = 26 6 41 07 026 00 0
- Press-on fixture 6 41 01 019 00 8
- Cable hook 0 72 00 310 06 6

Press-on fixture

For fastening the armature securely in place [\(40\)](#)

6 41 01 019 008

6.3. Types of grease / quantities of grease

Lubricant, company designation	Appear- ance	Technical data and consistency class	Application	Article No. of the complete package and type of package	Grease quantity and item
Greases					
0 40 <u>101</u> 0100 4 (old Sst1)	Light brown, beige, naturally cloudy, compact- pasty	Drop point: about 180°C Operative range: -30°C to +120°C NLGI:2	Normally loaded spur gears and roller bearings as well as plain bearings for higher speeds	Tube 85 g 32160003014 Tin 800 g 3213200701 Tin 4500 g 32132010015	Gear rack Item No. 780 Grease lightly
0 40 <u>106</u> 0100 1 (old Sst6)	Yellow Short- fibred	Drop point: about 190°C Operative range: -60°C to +130°C NLGI: 2	Neutral to ferrous and non- ferrous metals and stable plastics: PA, PF, PTFE, fluorelastomeres. FEIN: ZTN, ZTH, 2Z, 2RS – Roller bearing	Tube 85 g 32160003061 Tin 850 g 32132007033	Guide rail Item No. 720 (dovetail guide only) Grease lightly
0 40 <u>118</u> 0300 9	Beige, soft, flowing	Drop point: about 200°C Operative range: -40°C to 150°C NLGI: 00	Gear lubricant in electrical tools and tool machines. FEIN: Used in robots (permanent use), KBS and KBM	Tube 80 g 32160003182 Tin 850 g 32132007189 Tin 4500 g 32132010182	Gear : 80g Groove ball bearing: Item. No. 100, 290

6.4. Adhesives, sealants

Order Ref.	Designation	Color	Content	Description	Item quantity
0480050003	Loctite 574	Orange	250 ml 100 ml	Surface sealing, fast curing, gap up to 0.5 mm < for aluminum connections>	Sealing surface of gear parts (90, 280) Screw heads (140)
0480050033					
09000600401	Loctite 222 (old 221)	Purple	50 ml	Screw locking/ straight threads, low tightness screw locking, for tightening and sealing of threaded connections, vibration tight, can be disassembled easily, most favourable gap 0.05 mm, max 0.12 mm, for threads< M16, fine threads<M36, -55C to +150C, hand tight 15-30 min, final tightness 3hrs., storage time min 12 months	Threaded pins (760)

7. Change / Repair information

KBM 50 Q

until Nov. 2005

KBM 50 QX

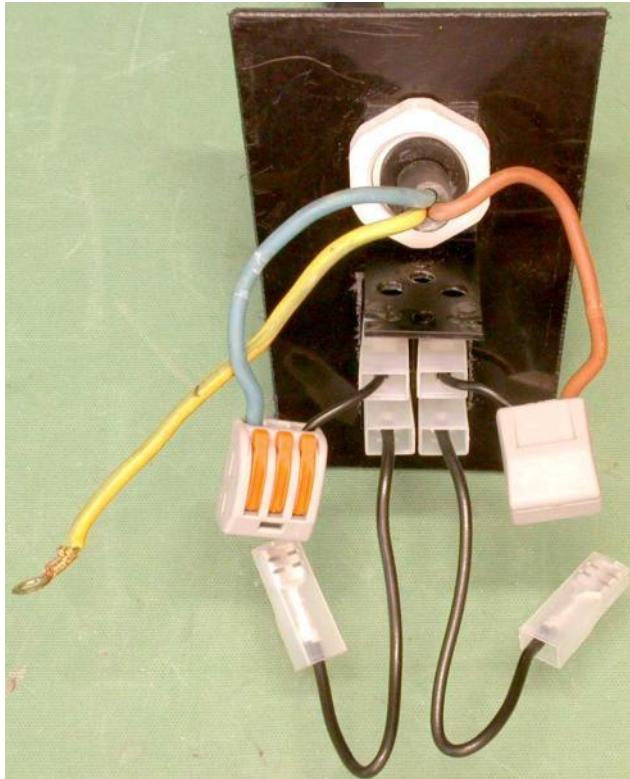

from Nov. 2005

In the course of a product optimization a reconstruction sentence became from November, 2005 for elektr. speed regulator for the KBM 50 Q introduced. With it the designation of the engine has also changed, now KBM 50 QX. Because the old material number (30762257996) is not available any more, the reconstruction sentence (30762274020) must be applied in the repair case fundamentally.
